I'm an organized person, and I don't like to have to remember what I last edited on any given file. Lightroom supports the concept of defining multiple "branches" of a catalog and then keeping track of which branch you were working on. What if I really like that "New Job Application" series and want to compare that Photoshop file with another one that you've already defined as a new catalog? Don't have to lose the thought. Simply bring up the Branch window and it's all filtered out for you. It's not the first time I've seen a piece of software do that. Lightroom offers three methods for processing photos: Develop, where you can alter all the characteristics of images; Crop them (advanced method) and Edit, where you can apply a few adjustments and, if you like, apply special effects to images. Lightroom's interface is easy to use and has many different ways of viewing images. You can use the main view window as well as a side panel. More than useful, the side panel is a great way to organize images, creating collections and groups. The former picture editor in question did see a lot of improvements in the last five years. Most of the changes that weren't present in previous versions were something I would have assumed would be improved in subsequent ones. Photoshop Sketch is also an iPad feature, and is one of the major updates, I believe. It's the ability to create "sketches" in Photoshop. The idea behind this is to allow you (supposedly) subconsciously create a number of design concepts in a variety of formats, and then choose the one that fits the picture. The idea is quite interesting, and I will discuss it separately when talking about how Lightroom 5 changed the way the program works. It's good to see Adobe Photoshop has made strides in mobility, and the iPad has become a very important platform for its development. In fact, the iPad Pro is the most powerful camera that can now be used as a camera in Photoshop.

For many, the reality is that no matter what way they develop images, they're going to use Photoshop. There are three steps to the process, and Lightroom is a great asset in the first two steps. But if you get to where you get to the third stage - which is really finding the details of your image and really making decisions - then you want to use Photoshop. So if you're going to do that, if you're going to really look at your image and say, "I want to change this," or "Maybe I want to enlarge this," or "Maybe I want to reduce that," then you're going to have to be in Photoshop. The difference is that with the blending modes, you still get access to the same kind of textures, but you can control what you get along with those textures with quite a lot of use of the opacity slider. You are using the fundamental design of Photoshop, as you can see it when you open it. But then you really need to know that it is one of the easiest photo editing program out there. The only thing you need to think about is which one is the best editor and how well it does what you imagine. This depends a little on the quality of your image, and the maximum resolution that you can think about for the bulk of the image editing is. It's never a bad idea to do the camera calibration with that old, familiar bracketing feature. This will take the guesswork out of any future adjustments to your camera or lens. But we're going to get into accessorial lighting issues in Hot Light. You can always use a good old fashion flash in Photoshop, but these are less common now for many cameras.
